                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      treatment of severe aplastic anaemia, leukaemia, and immune deficiency
                                                                                                                                                                                           The present sequence represents a new peptide (P1) constituting a T-cell epitope obtainable from the minor histocompatibility antigen HA-1. The peptide is immunogenic and can be used as part of a vaccine. P1 is used as a medicine, to induce tolerance for transplants, prevent rejection and/or graft versus host disease, or to treat (auto) immune diseases. In particular it can be used with bone marrow transplantation, in the
                                                                                                                                                                                                                                                                                                  A new minor histocompatibility antigen, HA-1 - useful to treat immune diseases and prevent rejection and host versus graft disease in bone marrow and organ transplantation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Minor histocompatibility antigen; HA-1; T-cell epitope; immunological; graft versus host disease; bone marrow transplant; leukaemia; vaccine; diagnosis; aplastic anaemia; immune deficiency disease.

The peptide is immunogenic and can be used as part of a vaccine. P1 is used as a medicine, to induce tolerance for transplants, prevent rejection and/or graft versus host disease, or to treat (auto) immune diseases. In particular it can be used with bone marrow transplantation, in the treatment of severe aplastic anaemia, leukaemia, and immune deficiency
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Minor histocompatibility antigen; HA-1; T-cell epitope; immunological; graft versus host disease; bone marrow transplant; leukaemia; vaccine; diagnosis; aplastic anaemia; immune deficiency disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents an immunogenic peptide constituting a T-cell epitope, obtainable from the minor histocompatibility antigen HA-1. The peptide can be used in vaccines or pharmaceutical formulations as medicines to induce tolerance for transplants so as to prevent rejection and/or Graft-versus-Host Disease, or to treat autoimmune diseases.

Neoplastic haematopoietic cells presenting the peptides, in an HIA class I context, can be eliminated after specific recognition of the peptides. The peptides can also be used to raise antibodies, T-cell receptor, B-and T-cells

The present sequence represents part of the minor histocompatibility antigen HA-1 R-allele. The specification describes methods for typing alleles (preferably the H and R alleles) of the minor histocompatibility antigen HA-1 in a sample, which comprise detecting polymorphic nucleotides in the cDNA or genomic nucleic acids of the alleles. The methods can be used for HA-1 typing for bone marrow transplants, severe aplastic anaemia, leukaemia and immune deficiency diseases, as well as detection of genetic aberrances. The probes and primers of the invention can be used to screen for the HA-1 alleles. The HA-1 peptides can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents part of the minor histocompatibility antigen HA-1 H-allele. The specification describes methods for typing alleles (preferably the H and R alleles) of the minor histocompatibility antigen HA-1 in a sample, which comprise detecting polymorphic nucleotides in the cDNA or genomic nucleic acids of the alleles. The methods can be used for HA-1 typing for bone marrow transplants, severe aplastic anaemia, leukaemia and immune deficiency diseases, as well as detection of genetic aberrances. The probes and primers of the invention can be used to screen for the HA-1 alleles. The HA-1 peptides can be used to screen for the HA-1 alleles. The HA-1 peptides can be used to screen for the HA-1 alleles. The HA-1 peptides can be used to screen for the HA-1 alleles. The HA-1 peptides can be used to screen for the HA-1 alleles. The HA-1 peptides can be used to screen for the HA-1 alleles.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SXS
                                                                                               The invention relates to a novel method for providing epitopes of allelic covariants of antigenic proteins from specific species based on single concleotide polymorphism (SNP), by defining target protein/peptide or its concleoting allelic peptide/protein variants, expression product or its selecting allelic peptide/protein variants, expression product or its concerning epitopes binding to MHC protein. A protein of the invention has cytostatic activity, and may have a use in a vaccine. The method is conserved proteins by applying the method for several protein from the concerning epitopes by profile of one or more individuals from a concerning epitopes binding to MHC protein. A protein of the invention has conserved the symplying the method for several protein from the concerning the supplying the method for several protein from the concerning the supplying the method for several protein from the concerning the supplying the method for several protein from the concerning the supplying profile was related to disease, preferably cancer This is useful for diagnosing a disease in an individual by concerning the supplying thematopoietic stem cells from a donor to a conserved profile that the invention concerning the supplying thematopoietic stem cells from a donor to a recipient and treating cancer, preferably leukaemia, and for determining the progression, regression or onset of a treated disease. The present extra concerning the supplication of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                   The invention relates to a novel method for providing epitopes of allelic CC variants of antigenic proteins from specific species based on single CC nucleotide polymorphism (SNP), by defining target protein/peptide or its CR subset, screening database of DNA encoding target protein, identifying, CC selecting allelic peptide/protein variants, expression product or its CR fragment encoded by DNA sequence having SNP, creating variant epitopes, CC selecting epitopes binding to MHC protein. A protein of the invention has CR cytostatic activity, and may have a use in a vaccine. The method is CR useful for generating a SNP profile of one or more individuals from a CR civilate where the SNP profile of one several protein from the CR individuals, where the SNP profile was related to disease, preferably CR cancer. This is useful for diagnosing a disease in an individual by CR generating the SNP-related polymorphic profile. A method of the invention CR is useful for transplanting haematopoietic stem cells from a donor to a ceipient and treating cancer, preferably leukaemia, and for determining CR the progression, regression or onset of a treated disease. The present CR sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           providing allelic variant epitope of protein based on single nucleotide polymorphism by defining target protein, screening database of protein, identifying, selecting allelic variant protein, creating variant

                                                                                                                                                                                                                  Ś
                                                                                                                                                                                                                                                                                                                                                                 CC This invention relates to novel isolated or purified peptides of the CC human respiratory syncytial virus (RSV), in particular ten RSV genes CC encoding 11 separate viral proteins: non-structural proteins NS-1 (also CC known as the 1C protein) & NS-2 (1B protein), a polymerase protein I and CC sight structural proteins preferably G also M, M2-1, M2-2, N, P, F, and CC SH (also known as the 1A protein). Specifically, it refers to a CC composition comprising an above peptide mixed with a pharmaceutical cc excipient or an RSV immunogenic composition comprising a recombinant CC expression vector with a nucleic acid insert encoding an above peptide. CC Tlymphocytes (CTLs) that respond to a major histocompatibility complex (CMHC) class I restricted T-cell stimulating peptide epitope of RSV. The CC (MHC) class I restricted T-cell stimulating peptide epitope of RSV. The CC (prophylactic or therapeutic) vaccine composition for a DNA-based CC immunisation, or for preparing an immune response provoking vaccine in the event of RSV infection (the vaccine being prepared by contacting the CC polypeptide in an immune response provoking an activity. This CC peptide sequence is a human RSV high binding affinity peptide of the CC invention.

Novel isolated polypeptide e.g. spike polypeptide, Env polypeptide, of severe acute respiratory syndrome virus (SARS), useful as vaccine for SARS.

Disclosure; SEQ ID NO 8174; 839pp; English.

The invention relates to isolated polypeptides of the severe acute CC respiratory syndrome (SARS) coronavirus. The polypeptides include spike CC (S or E2), env (E or sM), membrane (M or E1), hemagglutinin-esterase (HE CC or E3), and nucleocapsid (N) polypeptides, and the ORF1a and ORF1ab CC (replicase) polypeptides and their proteolytic fragments. The invention CC also relates to antibodies which recognise the polypeptides; nucleic codis encoding the SARS virus polypeptides; primers specific for SARS virus nucleic acids sequences; kits for amplifying SARS virus target nucleic acids; a double-stranded RNA molecule 10-30 nucleotides in length CC which is able to inactivate the SARS virus in a mammalian cell; an CC expression construct for recombinant expression of a SARS virus spike CC protein; a viral vector for in vivo delivery of a SARS virus polypeptide-cc encoding nucleic acid; and a mammalian cell line stably expressing a SARS virus antigen. The invention additionally provides a vaccine for the treatment or prevention of SARS comprising an inactivated SARS virus, a split SARS virus, a split SARS virus, a cc killed SARS virus, an attenuated SARS virus, a split SARS virus, a cc replicon particle comprising one or more SARS virus antigens; methods of comparatory virus antigens; method soff constitying a therapeutically active agent by measuring the effect of the agent on a SARS-related enzyme, and a method of treating a SARS patient comparation and inhibitors. The SARS virus polypeptides and colded caids can be used in the preparation and manufacture of vaccines

RESULT 11
The invention relates to a cytotoxic Yersinia pestis T-cell epitope, considered from any of the 1000 sequences of 9 amino acids appearing as ADZ49933-ADZ50932. Also included are predicting peptides that are captions or can be used as diagnostic tools (comprising predicting which peptides bind to a HMC molecule (not defined) with high affinity using a neural network with at least one of the following features: some or all contents of the inputs to the neural networks are generated using a hidden Markov model; or some or all of the inputs are encoded by an amino acid substitution matrix, different from an identity matrix) and a vaccine or diagnostic tool using a limited number such as at least 1, 2, 3, 4, 5, 8, 16, 32, 64, 128, 256, 512 of the peptides of ADZ49933-ADZ50932. In predicting peptides, the prediction of the neural network is combined with prediction or measurement of one of the following: proteasomal cleavage sites; MHC binding; presence of sequence or related sequence(s) in patent databases; TAP binding; gene or protein expression level; function of the protein; localization of the protein; and similarity to self proteins. The epitope is useful as a vaccine or diagnostic tool, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            for the treatment or prevention of SARS. The SARS virus polypeptides, antibodies against them, and SARS virus-specific primers and kits containing them are useful for diagnosing or identifying the presence of SARS in a biological sample. The present sequence represents a SARS coronavirus T-cell epitope. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

The present sequent a cytotoxic Yersinia pestis T-cell epitope of the invention.
                                                      sequences AAU71093-AAU71796 represent the 103P3E8-related protein and peptide fragments of the protein. 103P3E8 exhibits tissue specific expression in normal adult tissue, but it is also aberrantly expressed in many cancers including tumours of the prostate, bladder, kidney, colon, lung, breast, rectum and stomach. The 103P3E8 polynucleotide, its related protein and peptide fragments and specific PCR primers are therefore useful for diagnosing and treating cancer. A vector comprising a polynucleotide which encodes a single chain monoclonal antibody, that immunospecifically binds to an 103P3E8-related protein, and a ribozyme capable of cleaving a polynucleotide having the 103P3E8 coding sequence, are both useful in the preparation of a composition for treating a patient with a cancer that expresses 103P3E8. The sequences can be used in diagnostic methods to monitor the level of 103P3E8 gene products in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          103P3E8; prostate; bladder; kidney; colon; lung; breast; rectum; stomach; tumour; cancer; cytostatic; gene therapy; antibody therapy; ribozyme; single chain monoclonal antibody; serum; blood; urine; tissue; human;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 9

                                                                                                                                                                 Sequences AAU71093-AAU71796 represent the 103P3E8-related protein and peptide fragments of the protein. 103P3E8 exhibits tissue specific expression in normal adult tissue, but it is also aberrantly expressed in many cancers including tumours of the prostate, bladder, kidney, colon, lung, breast, rectum and stomach. The 103P3E8 polymucleotide, its related protein and peptide fragments and specific PCR primers are therefore useful for diagnosing and treathing cancer. A vector comprising a polymucleotide which encodes a single chain monoclonal antibody, that immunospecifically binds to an 103P3E8-related protein, and a ribozyme capable of cleaving a polymucleotide having the 103P3E8 coding sequence, are both useful in the preparation of a composition for treating a patient with a cancer that expresses 103P3E8. The sequences can be used in diagnostic methods to monitor the level of 103P3E8 gene products in serum, blood, urine and tissue and to thereby detect the presence of

                                                                                                                                                                                                                                                                                                       S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention relates to novel isolated or purified peptides of the CC human respiratory syncytial virus (RSV), in particular ten RSV genes CC encoding 11 separate viral proteins: non-structural proteins NS-1 (also CC known as the 1C protein) & NS-2 (1B protein), a polymerase protein L and CC SH (also known as the 1A proteins preferably G, also M, W2-1, M2-2, N, P, F, and CC composition comprising an above peptide mixed with a pharmaceutical cc excipient or an RSV immunogenic composition comprising a recombinant CC expression vector with a nucleic acid insert encoding an above peptide. CC Thymphocytes (CTLs) that respond to a major histocompatibility complex CC (MHC) class I restricted T-cell stimulating peptide epitope of RSV. The CC (MHC) class I restricted T-cell stimulating peptide epitope of RSV. The complexide is useful for preparing a diagnostic composition or an RSV (prophylactic or therapeutic) vaccine composition for a DNA-based CC immunisation, or for preparing an immune response provoking vaccine in CC the event of RSV infection (the vaccine being prepared by contacting the polytide equince in an immune response-provoking amount of specific CTL).

CC polypeptide in an immune response-provoking affinity peptide of the immunical activity. This composition is a human RSV high binding affinity peptide of the
                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                        문
                                                                                                    8
                                                                                                                                                                                                                                                                                                                        This invention relates to novel isolated or purified peptides of the CC human respiratory syncytial virus (RSV), in particular ten RSV genes CC encoding 11 separate viral proteins: non-structural proteins NS-1 (also CC known as the 12 protein) & NS-2 (1B protein), a polymerase protein I and CC sight structural proteins preferably G, also M, M2-1, M2-2, N, P, F, and CC structural proteins preferably G, also M, M2-1, M2-2, N, P, F, and CC exciptent or an RSV immunogenic composition comprising an above peptide mixed with a pharmaceutical CC expression vector with a nucleic acid insert encoding an above peptide. CC The present invention describes an in vitro method of detecting cytotoxic CC Tymphocytes (CTLs) that respond to a major histocompatibility complex CC (MHC) class I restricted T-cell stimulating peptide epitope of RSV. The CC (prophylactic or therapeutic) vaccine composition for a DNA-based CC (prophylactic or therapeutic) vaccine composition for a DNA-based CC the event of RSV infection (the vaccine being prepared by contacting the
                                                                                                                                          Query Match

    Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score

           Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Score

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Score

Goulmy EAJM, Hunt DF, Engelhard VH;

WPI; 1999-153312/13.

A new minor histocompatibility antigen, HA-1 - useful to treat immune diseases and prevent rejection and host versus graft disease in bone marrow and organ transplantation.

Claim 3; Page 32; 47pp; English.

The present sequence represents a new peptide (P1) constituting a T-cell epitope obtainable from the minor histocompatibility antigen HA-1. The peptide is immunogenic and can be used as part of a vaccine. P1 is used as a medicine, to induce tolerance for transplants, prevent rejection and/or graft versus host disease, or to treat (auco) immune diseases. In particular it can be used with bone marrow transplantation, in the treatment of severe aplastic anaemia, leukaemia, and immune deficiency diseases

Sequence 9 AA;
